Key Metrics, Critical Issues & Quick Wins

2. Audit Categories

What Works

Findings by Severity

3. Action Plan

Phased Roadmap

4. Data Sources & Methodology

1. Executive Summary

This report presents a comprehensive SEO audit of **easyyourtour.com** for a **Travel Agency / Agency** site, generated on July 30, 2026. Findings combine technical, content, schema, performance, visual, and search-readiness evidence as available.

34/100

SEO HEALTH SCORE

Critical Issues Found:

1. **Info:** Missing robots.txt and sitemap.xml files (Critical crawlability blockers)
2. **Info:** No Schema.org structured data (JSON-LD) detected site-wide
3. **Info:** Thin homepage content (~70 words of extracted text), lacking deep E-E-A-T signals
4. **Info:** Missing self-referencing canonical tag on the homepage
5. **Info:** No security headers (HSTS, X-Frame-Options, CSP, etc.) configured

Quick Wins:

1. Create and upload a basic robots.txt file with a pointer to sitemap.xml
2. Generate and submit a compliant XML sitemap via Google Search Console
3. Deploy self-referencing canonical tags in the <head> of every page
4. Configure Strict-Transport-Security (HSTS) and X-Frame-Options in NGINX
5. Implement the provided JSON-LD structured data for the TravelAgency and TouristTrip

2. Audit Categories

2.1 Technical SEO

Score: **28/100**

What Works

- Clean, descriptive URL structure with no query parameters or redirect chains
- Proper viewport configuration for mobile responsiveness
- HTTPS correctly implemented with a valid SSL certificate
- Traditional server-rendered HTML (non-SPA layout) - optimal for crawlability

Findings

Missing robots.txt file **Critical**

The site currently has no robots.txt file (404 status), meaning crawl bots receive no guidance or pathways, and the sitemap location is not declared.

Recommendation: Create a robots.txt file at the root with standard directives and a pointer to the XML sitemap.

Missing sitemap.xml file **Critical**

No XML sitemap is present on any common paths (sitemap.xml, sitemap_index.xml, sitemap-index.xml, etc.), meaning search engines must rely on slow, discovery-based link-following.

Recommendation: Generate an XML sitemap of all public URLs and submit it via Google Search Console.

Missing canonical tag **High**

No <link rel="canonical"> tag was detected on the homepage, presenting a risk of duplicate content issues if similar content is served on other URL variants (e.g. non-www, HTTP, trailing slash).

Recommendation: Add a self-referencing canonical tag in the <head> of the homepage pointing to <https://easyourtour.com/>.

Missing essential security headers **High**

The server response does not contain critical security headers (HSTS, X-Content-Type-Options, X-Frame-Options, Referrer-Policy, CSP), leaving the site vulnerable to common threats like clickjacking and MIME-sniffing.

Recommendation: Configure security headers directly in the server block (NGINX/Apache) or hosting platform configuration.

No IndexNow endpoint **Medium**

No IndexNow verification file or link tag is present, slowing down content discovery and indexation by non-Google search engines like Bing, Yandex, and Naver.

Recommendation: Generate an IndexNow API key, upload the verification text file, and include the indexnow link in the HTML header.

2.2 Content Quality & E-E-A-T

Score: 30/100

What Works

- High information density in existing copy (0.9 out of 1.0)
- Zero repetition or filler content detected in copy blocks
- Clear, readable formatting with modern visual presentation
- No evidence of low-quality AI content patterns

Findings

Thin content on the homepage **High**

The homepage contains only ~70 words of extracted text, which is significantly below the 500-word topical floor recommended for high-performing homepages.

Recommendation: Expand the homepage copy to 800-1,200 words covering services, detailed destination highlights, company story, and guest reviews.

Weak experience, expertise, and authority signals **High**

There is a severe lack of visible author bios, guide credentials, staff certifications, travel license disclosures, travel diaries, or co-branded partnerships.

Recommendation: Add certified guide profiles, display association logos (e.g., IATA, local travel license), and create a travel blog with first-hand guides.

Insufficient trust signals **Medium**

While the phone number and contact forms are available, there is no prominent physical address, secure booking badge, payment guarantee, or detailed refund and cancellation policy links.

Recommendation: Display a complete physical address and email in the footer; create dedicated 'About Us', 'Privacy Policy', and 'Cancellation/Refund Policy' pages with direct footer links.

Low AI search engine citation readiness **Medium**

The copy relies on generic marketing phrases (e.g., 'unforgettable guided tours') rather than structured, quotable facts and data tables that AI search engines (like ChatGPT or AI Overviews) can cite.

Recommendation: Insert unique data points, statistics, and precise package details (e.g. 'small-group tours limited to 8 guests', '3 nights at Fairmont Baku').

2.3 Schema Markup

Score: **0/100**

Findings

Complete absence of Schema.org structured data **Critical**

No structured data of any format (JSON-LD, Microdata, RDFa) was found, meaning search engines receive no machine-readable data about the travel agency, its destinations, packages, prices, or ratings.

Recommendation: Deploy valid JSON-LD scripts for WebSite, TravelAgency/Organization, TouristAttraction (destination pages), and TouristTrip + Offer + AggregateRating (tour pages).

2.4 Performance

Score: **99/100**

What Works

- Incredible mobile Lighthouse performance score of 99/100
- Largest Contentful Paint (LCP) is 1.6 seconds, well within the green threshold (<2.5s)
- Cumulative Layout Shift (CLS) is 0.03, showing outstanding visual stability (<0.1)
- Extremely fast server response times (under 100ms)

Findings

Potential render-blocking resources **Low**

A few Next.js critical static files and Google woff2 fonts can cause minor blocking on slow networks. No preload tags are currently defined for non-Next critical assets.

Recommendation: Use rel=preload for crucial custom fonts and audit third-party script deferral periodically.

3. Action Plan

Phase 1: Critical Fixes Week 1

- Create and upload a standard robots.txt file pointing to the sitemap.
- Generate and submit a standard XML sitemap via GSC.
- Deploy self-referencing canonical tags site-wide.
- Configure standard security headers (HSTS, X-Frame-Options, etc.) on the server.

Phase 2: Structured Data & Discovery Weeks 2-3

- Implement TravelAgency/Organization JSON-LD on the homepage.
- Deploy TouristTrip + Offer + AggregateRating schemas on popular tour landing pages.
- Add BreadcrumbList structured data to improve SERP breadcrumb pathways.
- Generate and set up the IndexNow endpoint for faster Bing/Yandex indexation.

Phase 3: Content Expansion & E-E-A-T Month 2

- Expand the homepage text block from ~70 words to 800-1,200 words covering key services and destinations.
- Add trust signals to the footer: a physical address, secure booking badge, and transparent policies.
- Feature guide profiles and certified travel agency license numbers to showcase expertise.
- Embed co-branded logos of reputable travel partnerships and travel association memberships.

Phase 4: AI Citation & Monitoring Ongoing

- Inject structured, quotable facts and data tables on tour pages to drive AI search engine citations.
- Establish an active blog with first-hand travel guides and 'Travel Diaries' to signal real-world experience.
- Monitor Google Search Console and Bing Webmaster Tools for indexation status and crawling crawl-rate.
- Perform monthly Lighthouse audits to verify the 99/100 performance score remains stable.

Data Sources & Methodology

Source	Description	Update Frequency
PageSpeed Insights API	Lighthouse lab audit (mobile emulation, Moto G Power, slow 4G)	Real-time
Chrome UX Report (CrUX)	28-day rolling field data from real Chrome users	Daily ~04:00 UTC
CrUX History API	25-week p75 trend data per metric	Weekly
Google Search Console	Search Analytics (clicks, impressions, CTR, position)	2-3 day lag
URL Inspection API	Per-URL index status, coverage state, crawl info	Real-time (2,000/day)
